T.O. 31R2-2URR-221C

SUPPLEMENT

TECHNICAL MANUAL

RADIO RECEIVER R-1051B/URR AND R-1051C/URR

F34601-72-D-0655

THIS PUBLICATION REPLACES T.O. 31R2-2URR-221-1, VOLUMES I AND II, DATED 9 FEBRUARY 1968 AND SUPPLEMENTS T.O. 31R2-2URR-221 DATED 4 FEBRUARY 1964. A SUITABLE REFERENCE TO THIS SUPPLEMENT WILL BE MADE ON THE TITLE PAGE OF THE BASIC PUBLICATION.

PUBLISHED UNDER AUTHORITY OF THE SECRETARY OF THE AIR FORCE

15 MAY 1972

1. PURPOSE.

This supplement is issued to amend the basic publication.

2. INSTRUCTIONS.

a. Make the following changes:

Application: Modification from 500-cps to 100-cps tuning increments.

Circuits Affected: 500-cps Synthesizer A2A6A4 and Spectrum Generator A2A6A5.

Controls Affected: CPS Switch (S6).

AIR FORCE - 23-6-72 - 250

R-1051/URR	R-1051C/URR
A2A6A4 500cps Synthesizer	A2A6A4 100cps Synthesizer
A1 - 7.1 Mixer	A1 - Preset Divider-Divide-by-Ten
A2 - Divide-by-Ten	A2 - 100cps Oscillator A2A2 - Phase Detector
A3 - 500cps Oscillator and Phase Detector	A3 - 7.1mc Mixer
A2A6A5 Spectrum Generator	A2A6A5 Spectrum Generator
A4 - 5kc Spectrum Generator	A4 - 1kc Pulse Inverter
CPS Switch A2S6 Positions	CPS Switch A2S6 Positions

b. The legend "R-1051/URR" wherever it appears throughout the manual is to be replaced with the legend "R-1051C/URR".

c. The following changes are to be made in the manual:

PAGE V

1. Paragraphs 4-291 and 4-294. Delete 5KC Spectrum Generator and replace with 1KC Pulse Inverter.

2. Paragraphs 4-296 and 4-309. Delete 500CPS and replace with 100CPS.

PAGE VI

3. Paragraph 5-14. Delete 500CPS and replace with 100CPS.

PAGE VIII

4. Figure 4-42. Delete 5KC Spectrum Generator and replace with 1KC Pulse Inverter.

5. Figures 4-43 and 4-44. Delete 500CPS and replace with 100CPS.

6. Figure 4-45. Delete Phase Detector Vector Diagram and replace with the following:

   Phase Detector Simplified Schematic Diagram and Output Waveforms.

7. Figure 4-46. Delete Divide-by-Ten Multivibrator, Simplified Schematic Diagram and replace with the following:

   Decade Divider, Simplified Schematic Diagram.

8. Figure 4-47. Delete Divide-by-Ten Multivibrator, Timing Diagram and replace with the following:

Divide-by-Ten Multivibrator, Simplified Schematic Diagram.

PAGE IX

9. Figures 4-58, 5-9 and 5-20. Delete 500CPS and replace with 100CPS.

PAGE XII

10. Figures 5-89, 5-91, 5-92 and 5-93. Delete 500CPS and replace with 100CPS.

11. Figure 5-99. Delete 5KC Spectrum Generator and replace with 1KC Pulse Inverter.

PAGE 1-1

12. Table 1-1, Line 10. Replace 500CPS Synthesizer with 100CPS Synthesizer.

PAGE 1-2

13. Figure 1-2 is replaced with new Figure 1-2, see page 4 of this supplement.

14. Paragraph 1-13, Line 3. Delete 56,000 and replace with 280,000.

PAGE 1-4

15. Paragraph 1-15.a. Delete 2 to 29.995 mc in 0.5-kc increments and replace with 2 to 29.995 mc in 0.1-kc increments.

PAGE 3-1

16. Paragraph 3-3, Column 1, Line 11. Delete AN/WRC-1 (AN/WRC-1) and replace with Radio Set AN/GRC-157.

17. Paragraph 3-9, Column 2, Lines 2 and 3. Replace AN/WRC-1 with Radio Set AN/GRC-157.

PAGE 3-2

18. Figure 3-1 is replaced with new Figure 3-1, see page 6 of this supplement.

PAGE 3-5

19. Table 3-1, Reference Designation S6. Delete Switch Position 500 and Equipment Response information and replace with the following:

Switch Position 100 to 900 and Equipment Response-R-1051C/UUR is tuned 100 to 900cps above frequency indicated by MCS and KCS digit indicators.

PAGE 4-2

20. Paragraph 4-16. Delete sentences 5 and 6 and replace with the following:

The Front panel switch allows the operating frequency to be changed in 100-cps increments. This tuning provides 280,000 discrete frequencies in which the receiver is locked to a very accurate frequency standard.

PAGE 4-3, 4-4

21. Figure 4-1 is replaced with new figure 4-1, see page 7 of this supplement.

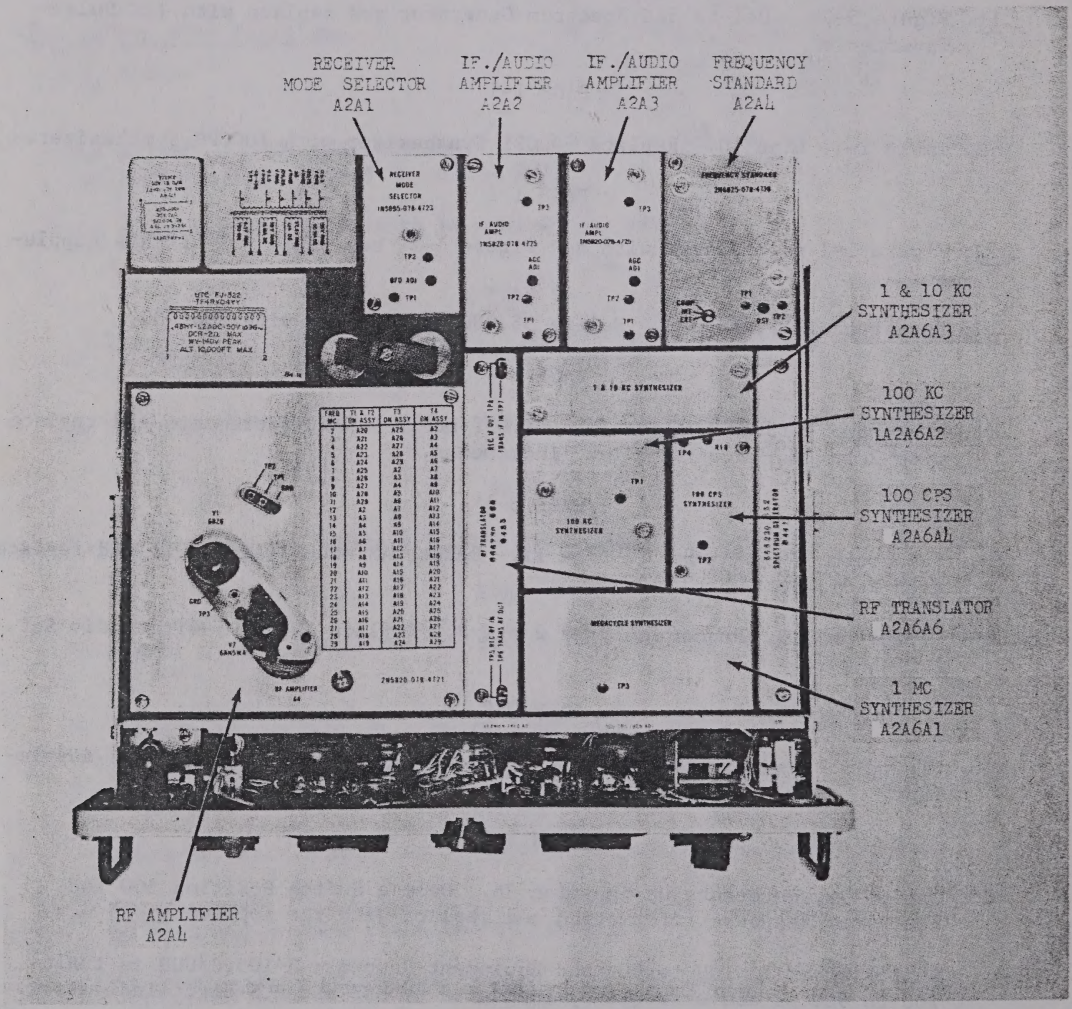

Figure 1-2. Radio Receiver R-1051C/URR, Top View, Case Removed

PAGE 4-7

22. Paragraph 4-35. Delete sentences 6, 7 and 8 and replace with the following:

The 1 KC Spectrum generator also produces 1 kc pulses which are applied to the 1kc pulse inverter. The 1kc pulse output from the inverter is in turn applied to the phase detector to derive the control voltage for phase locking the 100cps oscillator. For the purpose of the error cancellation discussion, assume that the front panel switch is in the 000 position: The output of the 100-cps phase locked oscillator then is at 110kc.

PAGE 4-8

23. Paragraph 4-36 is deleted and replaced as follows:

The R-1051C/URR can be tuned in 0.1 kc increments using the CPS switch, as well as any frequency in between using the VERNIER position of the CPS switch and the VERNIER control, both located on the front panel. The phase-locked oscillator in the 100 CPS Synthesizer uses a preset divider in the feedback loop along with a binary phase detector. This oscillator is locked from 110 to 119 kc in 1 kc increments with the divider preset to divide by a factor of 110 to 119, respectively. The output from the preset divider is therefore 1 kc, which is compared in the binary phase detector with the 1 kc pulses from the Spectrum Generator Electronic Assembly A2A6A5. The voltage from the phase detector is filtered and used as the control to maintain the oscillator in-lock for the desired preset division ratio. The output of the 100 cps oscillator is divided by ten and mixed with the 7.089 mc error frequency from the 1 and 10 kc Synthesizer Electronic Assembly A2A6A3 before being sent on to the 100 kc Synthesizer Electronic Subassembly A2A6A2. Since the 100 cps step displacements in the nominal 7.1 mc error frequency signal is injected, unlike the errors in the 1 and 10 kc oscillators, into only one path of the error cancellation loop previously described in paragraph 4-35, no cancellation of the 100 cps displacements takes place; thus permitting tuning of the receiver in 100-cps increments. In the VERNIER mode, the phase lock loop is disabled and the 100 CPS oscillator is "varicap" tuned by a variable dc bias voltage from the front panel VERNIER control.

PAGE 4-9

24. Figure 4-2. Delete data in columns 6 thru 11 and replace with new data from Figure 4-2, see page 10 of this supplement.

PAGE 4-78

25. Paragraph 4-287, Line 9. Delete 500cps and replace with 100cps.

26. Paragraph 4-288, Line 23. Delete 500cps and replace with 100cps.

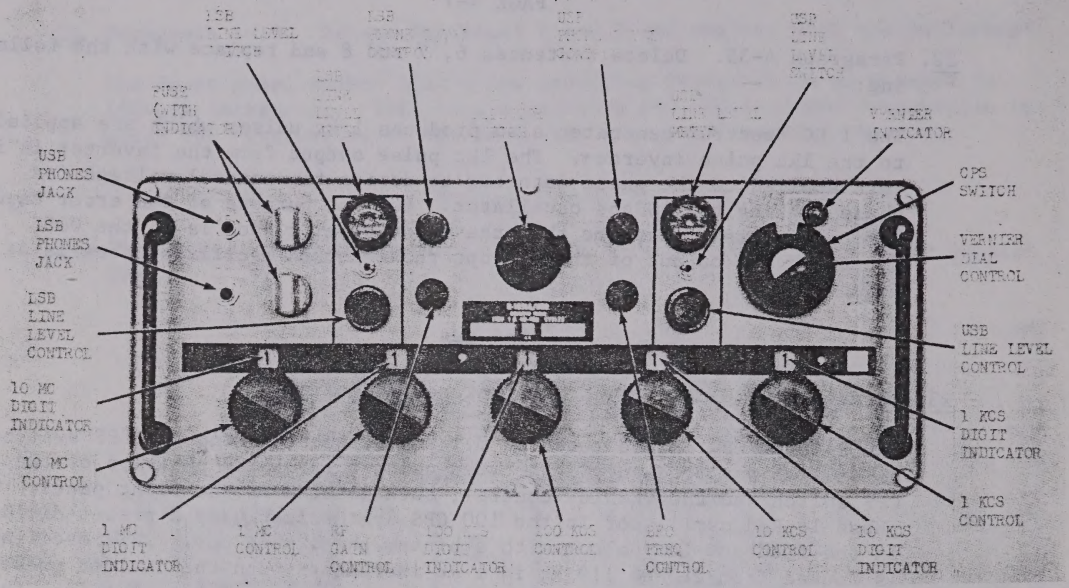

Figure 3-1. Radio Receiver R-1051C/URR, Operating Controls, Indicators, and Connectors

PAGE 4-79

27. Paragraph 4-291. Delete 5KC SPECTRUM GENERATOR, FUNCTIONAL CIRCUIT DESCRIPTION and replace with 1KC PULSE INVERTER, FUNCTIONAL CIRCUIT DESCRIPTION.

28. Paragraph 4-292 is deleted and replaced as follows:

The 1 kc pulse inverter (figure 4-42) consists of an overdriven amplifier (Q1). This amplifier is a part of Spectrum Generator Electronic Subassembly A2A6A5 and supplies accurate 1 kc reference pulses required by the phase detector A2A6A4A2A2 to phase lock the 100 cps oscillator. The 1 kc pulse inverter is used in all modes of operation. The following paragraphs describe the operation of the 1 kc pulse inverter in detail.

29. Paragraph 4-293 is deleted and replaced as follows:

The input to the 1 kc pulse inverter is the 1 kc pulse output of the divide-by-five multivibrator (Q3 and Q4) in the 1 kc spectrum generator A2A6A5A3. The 1 kc pulses are coupled to the base of the pulse amplifier Q1 through isolation resistor R4 in order to reduce the amplifier loading on the divide-by-five multivibrator. Resistor R4, in conjunction with resistor R5, also forms a voltage divider to supply base bias for amplifier Q1. Resistors R2 and R3 form a voltage divider to furnish a low collector voltage and a relatively stiff collector voltage source to

insure that amplifier Q1 is always driven into saturation by the input pulses, thus improving output amplitude uniformity and pulse waveform. Resistor R1 and capacitor C1 form the decoupling network for the collector voltage source. The output of the 1 kc pulse inverter is applied to the 100 CPS Synthesizer Electronic Subassembly A2A6A4.

30. Paragraph 4-294. Delete 5KC SPECTRUM GENERATOR and replace with 1 KC PULSE INVERTER.

31. Paragraph 4-295, Line 2. Delete 5 kc spectrum generator and replace with 1 kc pulse inverter.

32. Figure 4-42 is replaced with new Figure 4-42, see page 12 of this supplement.

PAGE 4-80

33. Paragraph 4-295.d. Delete 5 KC Spectrum Generator and replace with 1 KC Pulse Inverter.

34. Paragraph 4-295.f. is deleted.

35. Paragraph 4-296. Delete 500 CPS and replace with 100 CPS.

36. Paragraph 4-297 is deleted and replaced as follows:

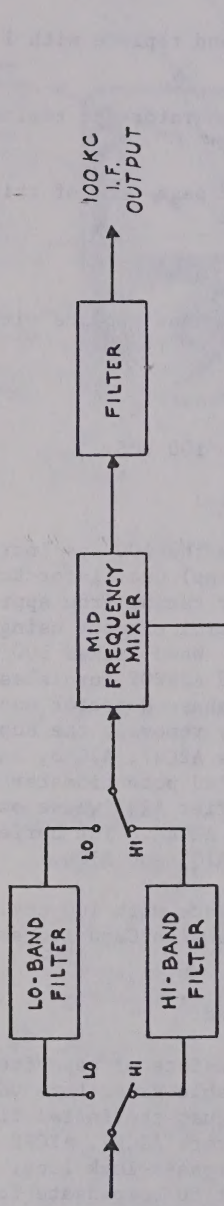
The oscillator (figure 4-43) utilized to generate the 100 cps increments and vernier frequency is a modified Colpitts (Clapp) Oscillator tuning from 110 to 119 kc in 1 kc steps, and the vernier tuning from approximately 108 to 122 kc is accomplished by a reactance control circuit using the voltage variable-capacitors A2CR7, A2CR8, A2CR9. When locked 100 cps steps are required, the phase detector A2A2Q1 and A2A2Q2 furnishes necessary control voltages. For vernier tuning, the phase detector and the preset counter A1A5 through A1A12 are disabled by removing the supply voltage. Voltage to the voltage variable-capacitors A2CR7, A2CR8, and A2CR9 is then obtained from the manually controlled potentiometer R7. The oscillator A2Q2 is coupled to a buffer amplifier A2Q3 whose output is stabilized by a set of limiting diodes A2CR5 and A2CR6. The buffer amplifier A2Q3 supplies an input to the pulse shaper A1Q5 and A1Q6.

37. Paragraph 4-298, Line 2. Delete 500 cps and replace with 100 cps. Line 8, delete Capacitors C2 and C3 filter and replace with Capacitors C1 filters.

38. Paragraph 4-299 is deleted and replaced as follows:

The tank circuit of the Clapp oscillator A2Q2 consists of capacitors A2C9, C10, C11, C13, C14, C15, C5 and the voltage variable-capacitors A2CR7, CR8, and CR9. Capacitor A2C14 is selected to adjust the intial frequency of oscillator A2Q2. The voltage variable-capacitors A2CR7, A2CR8 and A2CR9 provide the required pulling range for the phase-lock loop. Capacitor A2C15 has a negative temperature coefficient to compensate for temperature changes in the oscillator A2Q2. The parallel and series combination of these capacitors is identified by the single variable capacitor

Replace "LO, 000 CPS", "LO, 500 CPS", "LO VERNIER", "HI, 000 CPS", "HI, 500 CPS" and "HI, VERNIER", columns with the following:



LO 000 CPS TO 900 CPS IN 100 CPS Steps	LO VERNIER	HI 000 CPS TO 900 CPS IN 100 CPS Steps	HI VERNIER
22.4000 to 22.4009	22.3998 to 22.4012	32.4000 to 32.4009	32.3998 to 32.4012
22.5000 to 22.5009	22.4998 to 22.5012	32.5000 to 32.5009	32.4998 to 32.5012
22.6000 to 22.6009	22.5998 to 22.6012	32.6000 to 32.6009	32.5998 to 32.6012
22.7000 to 22.7009	22.6998 to 22.7012	32.7000 to 32.7009	32.6998 to 32.7012
22.8000 to 22.8009	22.7998 to 22.8012	32.8000 to 32.8009	32.7998 to 32.8012

23.2000 to 23.2009	23.1998 to 23.2012	33.2000 to 33.2009	33.1998 to 33.2012
23.3000 to 23.3009	23.2998 to 23.3012	33.3000 to 33.3009	33.2998 to 33.3012

Figure 4-2. Frequency Translation, Functional Block Diagram

C1, in the AC equivalent oscillator circuit of figure 4-44. This circuit, supplied as an aid to analyzing the oscillator tank circuit, shows that capacitor C1 and the primary of transformer T1 form a parallel resonant tank circuit for oscillator Q2.

39. Paragraph 4-300 is deleted and replaced as follows:

The regulated 15 vdc present at Zener diode A2CR1 is filtered by A2C1 and applied to the VERNIER control on the front panel. The regulated 4 vdc present at Zener diode A2CR2 is filtered by A2C2 and applied to the divider circuit, A1A1 through A1A4, and the pulse shaper A1Q5 and A1Q6.

PAGE 4-81, 4-82

40. Figure 4-43 is replaced with new Figure 4-43, see page 14 of this supplement.

PAGE 4-83

41. Figure 4-44 is replaced with new Figure 4-44, see page 15 of this supplement.

42. Paragraph 4-301 is deleted and replaced as follows:

When operating voltage is applied to oscillator Q2, the oscillator produces an output of approximately 110 to 119 kc, depending upon the CPS switch setting. These output frequencies only approximate the desired operating frequencies until the phase-lock loop is closed. Output from oscillator Q2 is limited by diodes CR5 and CR6. The negative-going limit of the signal is established by the anode bias minus the forward drop across diode CR6. The positive-going limit of the signal is established by the cathode bias plus the forward drop across diode CR5.

43. Paragraph 4-302 is deleted and replaced as follows:

The output of oscillator Q2 is applied directly to the base of amplifier Q3, which in turn develops the signal across resistor R20. Amplifier Q3 provides oscillator isolation, preventing the succeeding stages from loading the oscillator. The output of amplifier Q3 is coupled to the base of pulse shaper Q6 by capacitor C13. A small amount of degeneration is developed by the unbypassed emitter resistor R19 to increase the stability of amplifier Q3.

44. Paragraph 4-303 is deleted and replaced as follows:

The pulse shaper A1Q5 and A1Q6 is a Schmitt trigger circuit developing a negative output pulse having a sharp leading edge. The output drives the divide-by-ten circuit A1A1 through A1A4, and the present divider circuit A1A5 through A1A12. The pulse shaper consists of transistors A1Q5 and A1Q6.

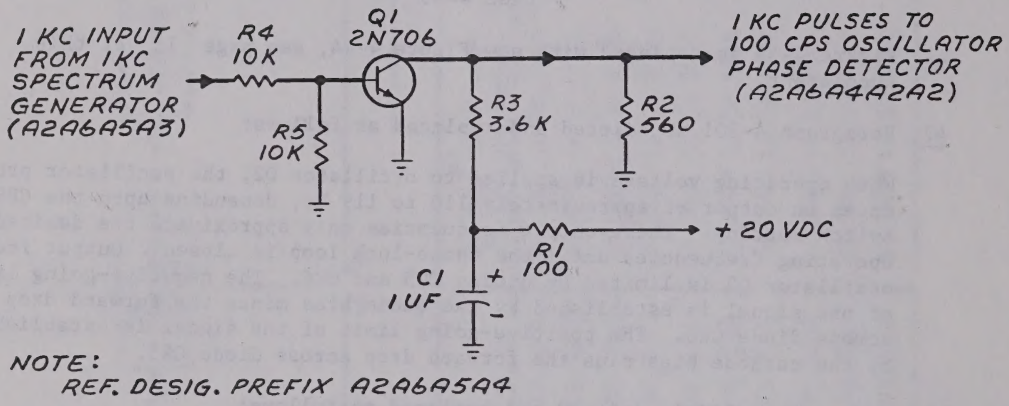

Figure 4-42. 1 KC Pulse Inverter, Simplified Schematic Diagram

45. Paragraph 4-304 is deleted and replaced as follows:

The 1 kc pulse output from the spectrum generator is coupled to phase detector A2A2Q1 and A2A2Q2 by capacitor A2C6. The output of the preset dividers A1A5 through A1A12 is coupled to the phase detector by capacitors A2A2C3 and A2A2C4. The phase detector output voltage is applied to amplifier A2Q1 by a network consisting of resistor A2R3 and capacitor A2C3. The output is filtered and controls the frequency of the oscillator A2Q2.

46. Paragraph 4-305 is deleted and replaced as follows:

The preset divider A2A6A4A1 is a digital circuit composed of flip-flop circuits A1A5 through A1A12 and coded from switch S6 on the front panel. When a preselected count is reached, the coincident gate triggers a circuit to reset the dividers. The preset dividers are reset to zero and a count is initiated by pulses derived from the oscillator A1Q2. The count continues until coincidence is reached at some digitally preselected count originated by the position of S6, then reset is inaugurated. The counter reset-to-zero time must be shorter than the incoming pulses. When the counter is reset, a trigger is also generated for the binary phase-detector A2A2Q1 and Q2. (This frequency is divided by ten for 100 cps increments.) If the oscillator frequency is precisely the frequency for which the preset divider is coded, the reset circuit output will be exactly 1 kc. If, however, there is a 0.5 per cent error in the oscillator frequency, the reset trigger output frequency to the phase detector will contain the same per cent error, or 5 cps. When this signal is compared by the phase detector against the 1 kc derived from the frequency standard, a phase-detector correction voltage is generated. This voltage, by means of A2CR7 through A2CR9, corrects the oscillator frequency so that the divider output is 1 kc, thus maintaining the oscillator in lock with the frequency standard. A1A5 thru A1A12 is a decade divider which may be coded to divide by any number between 110-119. Therefore, any oscillator A2Q2 frequency between 110-119 kc may be divided down to 1 kc for phase comparison in the phase detector A2A2Q1 and A2A2Q2 with the standard reference pulse. This produces increments from 110 to 119 kc. A series divider chain is used with one significant divider group providing a coded count that is representative of the corresponding frequency digit. This divider chain consists of a decade divider group A1A5 through A1A8 and a divide-by-eleven group A1A9 through A1A12, of four flip-flops each.

In order to accomplish division by ten using binary elements, feedback must be employed within the decade divider which consists of a binary divider followed by three binary dividers in a divide-by-five configuration. The feedback which is actually in the divide by five is accomplished by means of a diode steering gate (see figure 4-46A). The preset dividers A1A5 through A1A8 have been designed to divide by a maximum of ten, but may be programmed by switch S6 on the front panel to divide by any integer less than ten. The four flip-flops in the decade are arranged to generate a binary code. This is accomplished by diode coding gates which, when energized, contribute to the generation of a reset pulse. The table included in figure 4-46A indicates the combination of coding leads to be energized in order to achieve the desired divider counting. Figure 4-46B indicates the method of programming a decade of the preset divider. The absence of a coding voltage at any one of the four gates effectively removes the flip-flop corresponding to that gate

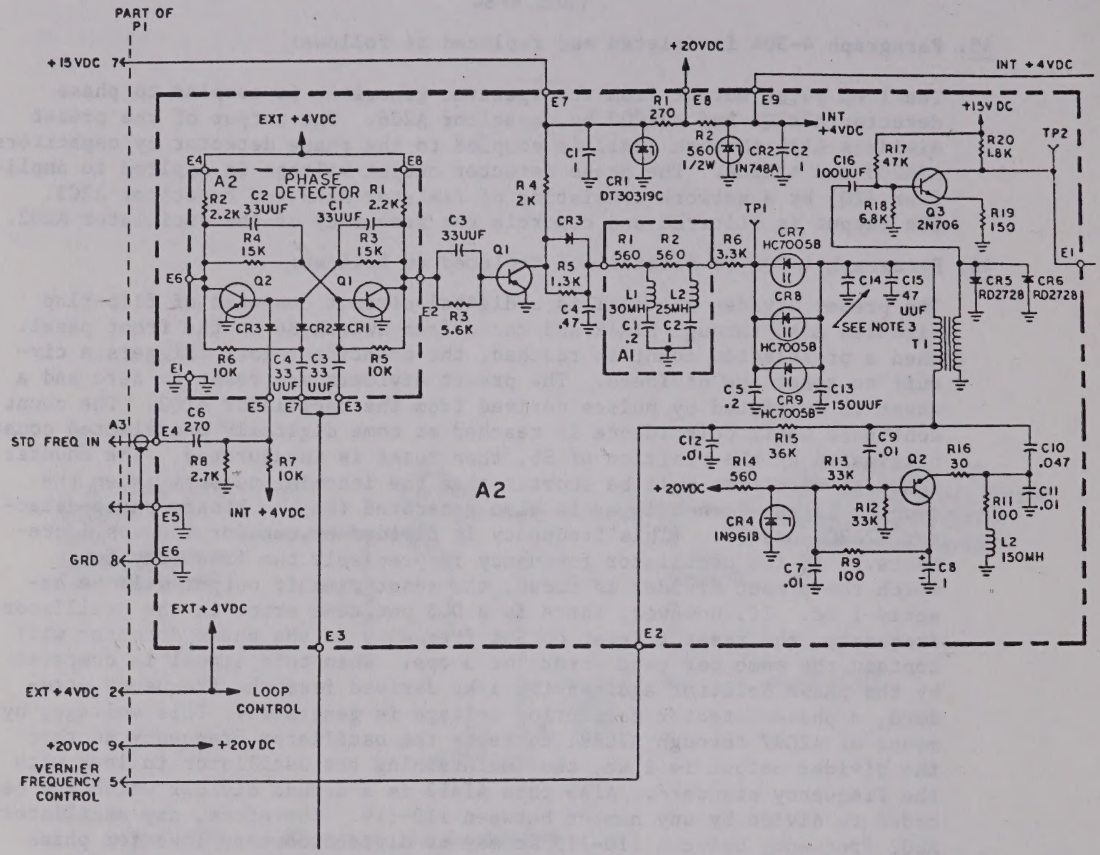

Figure 4-43. 100 CPS Oscillator, Simplified Schematic Diagram

from the coincidence circuit. By selectively energizing 0, 1, 2, and 3 lines-per-decade, the coding from 0 to 9 is accomplished.

The decade divider's output is fed to four cascade flip-flops, three of which have fixed coding gates, and one with no coding gate. This arrangement provides a divide-by-eleven function. The gates being energized at all times place the three flip-flops in the coincident circuit.

The gate outputs from the decade and the divide-by-eleven are summed to provide control voltage for the reset pulser. When the entire programmed count is reached, the disappearance of control voltage at the output gates initiates the reset pulse.

47. Paragraph 4-306 is deleted and replaced as follows:

The reset pulse is applied to the common input terminal of a Binary Phase Detector A2A2Q1 and A2A2Q2. The Binary Phase Detector is basically a flip-flop (figure 4-45A). Reset pulses are applied to the input while

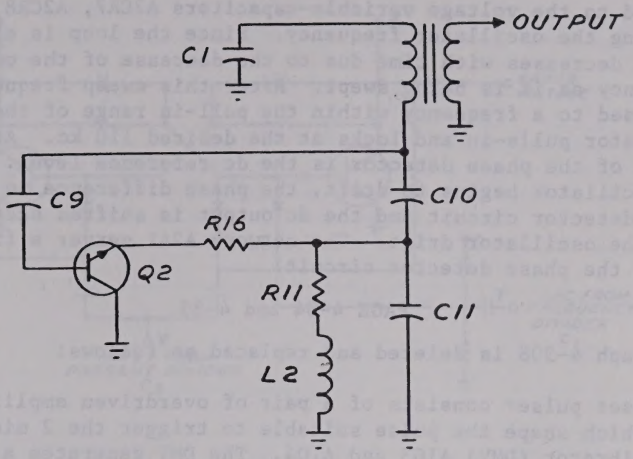

Figure 4-44. 100 CPS Oscillator, AC Equivalent Circuit, Schematic Diagram

the 1 kc Standard Frequency Reference pulse is applied to the base of A2A2Q2 by means of A2C6 and A2A2CR3. Therefore, the output will be a pulse with a duration equal to the time between the input reference and the preset divider output, if the input frequencies are both equal. If the output is a symmetrical waveform, the triggers are 180 degrees out of phase. When a low-pass filter is employed, the flip-flop output provides an average voltage which is a linear function of the phase difference. Thus, for the case where the phase detector output is a symmetrical waveform (180 degree phase relationship), the average voltage from the filter will be one-half of the peak-to-peak phase detector output. This circuit permits up to 360 degrees of control in phase between two signals, whereas the usually sinusoidal type of phase detector permits only 180 degrees of control. If the frequency of one signal is different from the other, the triggers will pass each other in time, and the average output from the circuit will be a sawtooth. These cases are shown in figure 4-45B for $f_1 = f_2$, f_2 f_1, and f_1 f_2. In the feedback loop, the filter network is designed to have a roll-off at 50 cps. Consequently, the capture range is equal to hold-in range. Traps at 1 kc and 2 kc (A2A1) are provided to suppress the ripple due to the phase detector circuit. The filtered dc output is then applied to the voltage variable capacitors A2CR7, A2CR8, and A2CR9 which execute reactance control of the oscillator A2Q2, tuning it to a frequency that is preset into the divider chain.

48. Paragraph 4-307 is deleted and replaced as follows:

Assume that the output of the oscillator is 110.2 kc. The desired oscillator frequency is 110 kc. The oscillator output of 110.2 is coupled to the pulse shaper circuit. This output is coupled to the preset dividers and divided down by a factor of 110 to a frequency of 1.02 kc. This output is applied to the phase detector by capacitors A2A2C3 and A2A2C4. A 1 kc pulse from the frequency dividers is also coupled to the phase detector by capacitor A2C6. The two inputs, 1 kc and 1.02 kc, are compared and an ac voltage is developed. This output is coupled to amplifier A2Q1 and filtered in the filter network A2A1. The voltage is then

applied to the voltage variable-capacitors A2CR7, A2CR8, and A2CR9, thus sweeping the oscillator frequency. Since the loop is closed, the frequency decreases with time due to the decrease of the oscillator output frequency as it is being swept. After this sweep frequency has been decreased to a frequency within the pull-in range of the oscillator, the oscillator pulls-in and locks at the desired 110 kc. At this time, the output of the phase detector is the dc reference level. If the phase of the oscillator begins to drift, the phase difference is detected by the phase detector circuit and the dc output is shifted accordingly to correct the oscillator drift. The network A2A1 server a filter for the output of the phase detector circuit.

PAGE 4-84 and 4-85

49. Paragraph 4-308 is deleted and replaced as follows:

The reset pulser consists of a pair of overdriven amplifiers A1Q1 and A1Q2 which shape the pulse suitable to trigger the 2 microsecond delay multivibrator (DMV) A1Q3 and A1Q4. The DMV generates a 2 microsecond negative pulse which is applied to the reset diodes of all the multivibrators in the preset counters A1A5 through A1A12. The count is now complete and a new identical sequence follows.

50. Figure 4-45 is replaced with new Figure 4-45, see page 17 of this supplement.

57. Paragraph 4-310.g. is deleted.

58. Paragraph 4-312 is deleted and replaced as follows:

The divide-by-ten multivibrator circuit (figure 4-47) consists of a pulse shaper (Q5 and Q6), and a divide-by-five circuit (A1A1, A1A3, and A1A4). These circuits, which form a part of 100 CPS Synthesizer Electronic Subassembly A2A6A4, divide the 100 to 119 kc output from the 100 cps oscillator A2A6A4A2 by ten to provide the 11 to 11.9 kc signal required for mixing in the 7.1 mc mixer A2A6A4A3. These circuits are used in all modes of operation. The following paragraphs describe the operation of the divide-by-ten multivibrators in detail.

59. Paragraphs 4-313 is deleted and replaced as follows:

The operating voltage for the divide-by-ten multivibrators is the positive 4 vdc output from Zener diode CR2. Zener diode CR2 provides a regulated 4 vdc power source by drawing enough current, in addition to the

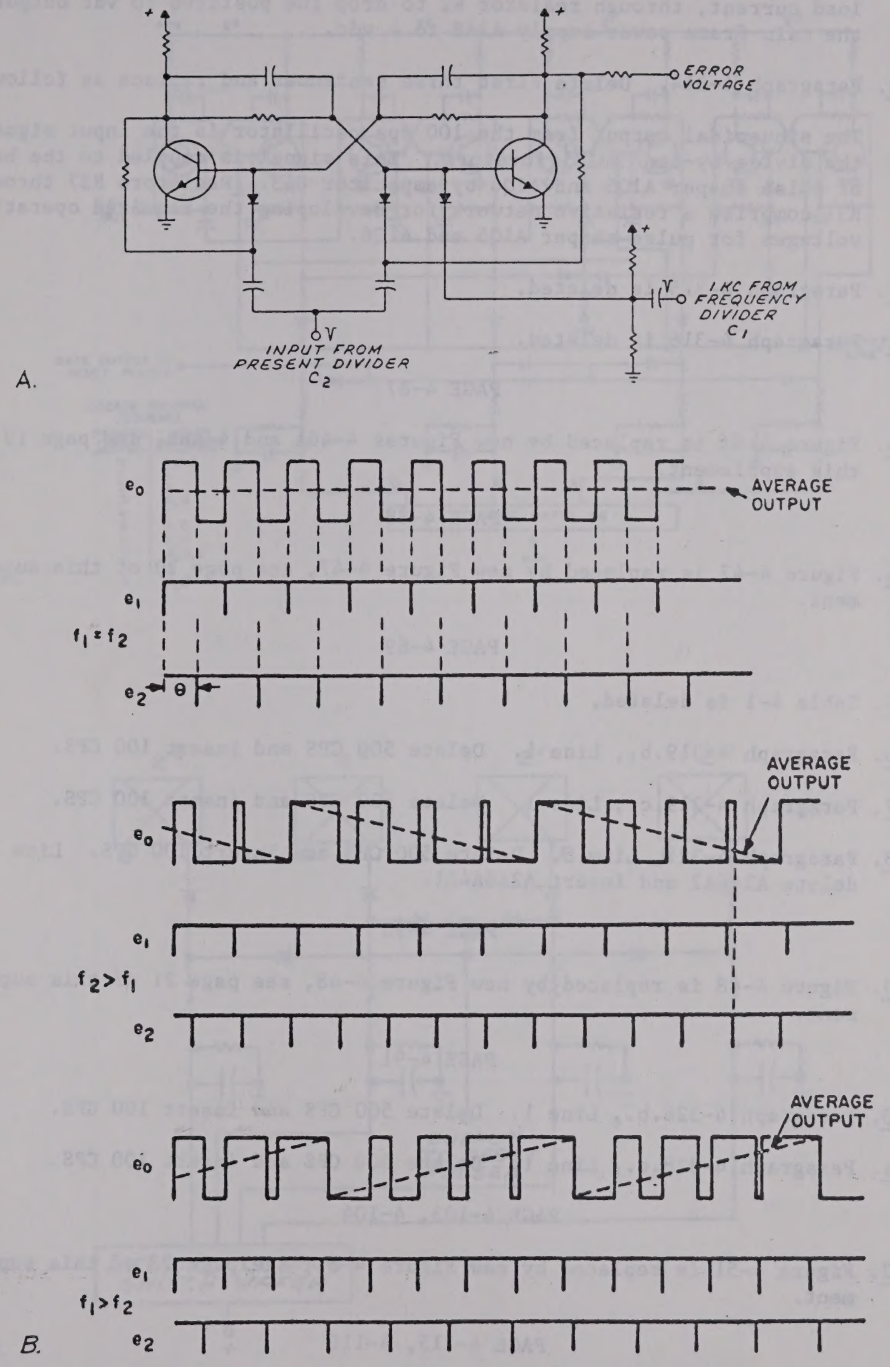

Figure 4-45. (A) Phase Detector, Simplified Schematic; (B) Phase Detector Waveforms

load current, through resistor R2 to drop the positive 10 vdc output from the main frame power supply A2A8 to 4 vdc.

60. Paragraph 4-314. Delete first three sentences and replace as follows:

The sinusoidal output from the 100 cps oscillator is the input signal for the divide-by-ten multivibrators. This signal is coupled to the base of pulse shaper A1Q5 and A1Q6 by capacitor C13. Resistors R27 through R31 comprise a resistive network for developing the required operating voltages for pulse shaper A1Q5 and A1Q6.
